Agricultural machinery is a key factor in mechanized farming and modern agriculture. Agricultural machinery is any kind of machinery used in farming or other agriculture applications. There are many types of such equipment, from hand tools and power tools to tractors and the countless kinds of farm implements that they tow or operate. The well-known example of this kind is the tractor.

## کسب اطلاعات فنی

A tractor is an agricultural/engineering vehicle. Agricultural implements may be towed behind or mounted on the tractor and a tractor may also provide a source of power if the implement is mechanized. A farm tractor is used for pulling or pushing agricultural machinery or trailers, for ploughing, tilling, disking, harrowing, planting, harvesting and other similar tasks.

There are different types of tasks, such as soil cultivation (soil tillage), planting (sowing), etc. For these, there are also different machines or equipment. Some of them are listed below.

Soil Tillage Machinery (Soil Cultivation Machinery): Moldboard Plows, Disk Plows, Chisel Plows and Rotary Plows are used for primary tillage. Disk Harrows, Tooth Harrows, Rollers and Land Leveller are used for secondary tillage.

Planting (Sowing) Machinery: Broadcaster, Seeders, Grain Drills, Row Crop Planters, Trans Planters and Combinata.

Plant Protection Machinery (Fertilizing & Pest and Weed Control Machinery): fertilizer spreader, slurry tank, sprayer

Harvesting Machinery: combine harvester, potatoes harvester, hay forage harvester, baler and mower are some of important harvester's in Iran.

Iran produces agricultural machinery such as tractor, combine and other related equipment by more than 300 manufacturers.

الف - خواندن و درک مطلب

Agricultural machinery uses mostly diesel internal combustion engines, as most agricultural operations are carried out in motion, for tractors, harvesters, and self-propelled sprinklers, among others. In general, these engines are divided into two categories: two-stroke cycle and four-stroke cycle engines.

In tractors and combine harvesters, the diesel engines are commonly four-stroke cycle type. A four-stroke cycle engine completes four strokes in one operating cycle, including: intake, compression, power, and exhaust strokes.

All four-stroke cycle engines have common parts regardless of the type. Some of them are listed below.

All four-stroke cycle engines have common parts regardless of the type. Some of them are listed below.

- Cylinder block is the main house of the engine and supports the other main parts.
- Crankshaft receives the force from the pistons and transmits it as rotary driving power.

- Connecting rod transmits the reciprocating motion of the piston into rotary motion of the crankshaft.
- Piston moves up and down in the cylinder by the force of combustion.
- Piston rings seal the compression in the combustion chamber and also help to transfer heat.
- Cylinder head is at the top of the engine and houses the valves and the intake and exhaust passages.
- Valves open and close to let fuel in and exhaust gases out of each cylinder.
- Camshaft rotating in the engine block opens valves by cam action.
- Cylinder is a hollow tube in which the piston works. This may be cast into the cylinder block or made of liner and sleeve.
- Main bearings support the crankshaft in the cylinder block.
- Flywheel attaches to the crankshaft and gives it momentum to return the piston(s) to the top of the cylinder(s) after each downward thrust.
- Timing drives (timing gears) link the crankshaft, camshaft, and other key parts together to assure that each is doing its job at the right time.
- Injection nozzle (Fuel injector) atomizes and sprays fuel into the cylinder.

Although there is no spark plug of the diesel engine, it is a key part in the petrol engine (in US: gasoline engine).

Note

Never open the radiator cap when the engine is hot. Always wait for the engine to cool down.

Remember

In Tabriz, there is the largest manufacturer of diesel engines in the country with the services and equipment necessary to design and manufacture three-, four- and six-cylinder engines for various applications, such as agriculture, automobile, industrial, road machinery, etc.

## الف - خواندن و درک مطلب

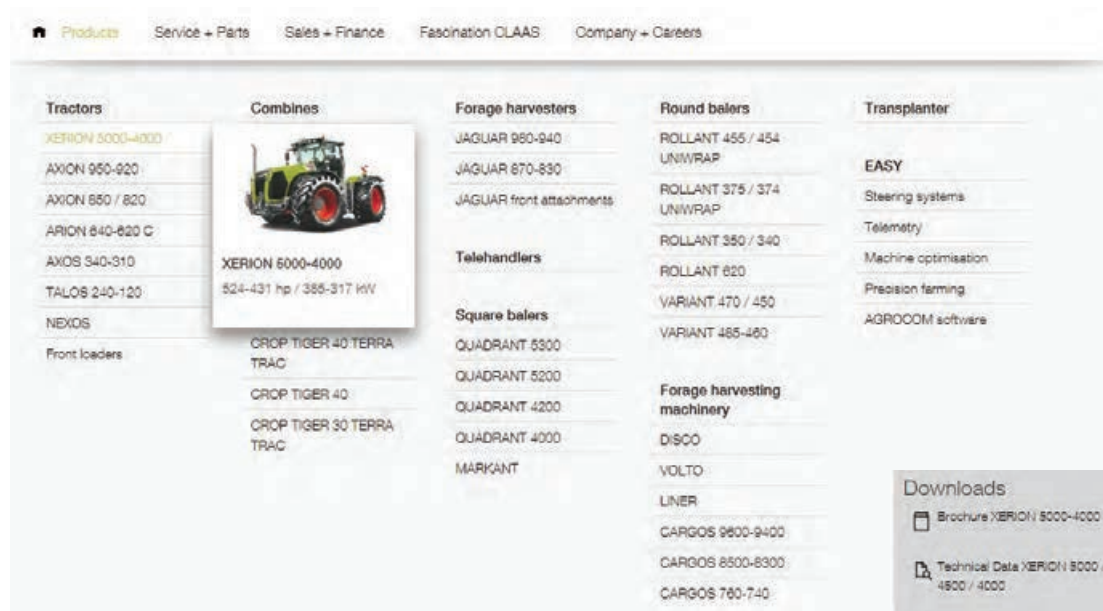

Choosing agricultural machinery has been a problem for farm operators and unrelated engineers ever since agriculture became mechanized. The wide variety of sizes, types and brands of machinery created an infinite number of combinations, and the complexity of the relationships which affect machinery costs and performance make the decision difficult. Knowing what to look for when buying any machinery can save time and money. The tractor is the most frequently used power source on farms throughout the year, unlike other agricultural machinery which have specific and occasional use. For that reason, some of the most important factors to choose a tractor are listed in the following questions.

<ul style="list-style-type: none"> <li>● How to choose a machinery size?</li> <li>● What <b>specifications</b> to look for?</li> <li>● Which brand is the best?</li> <li>● How much <b>horsepower</b> is needed?</li> <li>● What type of tractor is required?</li> <li>● What about the <b>model</b>?</li> <li>● What type of <b>transmission</b> do you want?</li> <li>● <b>Two-wheel drive</b> (2WD), <b>Four-wheel drive</b> (4WD), <b>front-wheel drive</b> (FWD) or <b>rear-wheel drive</b> (RWD)?</li> <li>● What equipment will you need?</li> <li>● What about <b>regular maintenance</b>?</li> <li>● What about <b>after-sales service</b>?</li> <li>● What investment can you make?</li> </ul>	
--	---

Keeping the related factors in mind can help guarantee customers/operators end up with the best tractor for the specific needs.

To find answers to the above questions, you can refer to the website of the manufacturers of agricultural machinery (or the products catalogues) and compare with what you need. The websites (or the products catalogues) of relevant companies usually provide good information including the types of products, after-sales services, warranties, agencies,

catalogues, parts, accessories, technical specifications of the machines and how to purchase them. In the following picture, a website of the machinery company is presented, which shows the items of “Products” option along with the figure of a highlighted model of “Tractors” option.

Never buy a tractor based on HP, it is very deceiving. And never buy any machinery without seeing it in person.

Remember

More than 70% of Iran’s agricultural machinery are nationally manufactured and the rest are imported. In Iran, an agricultural mechanization coefficient of 105 horsepower per hectare is reported.

### الف - خواندن و درک مطلب

All farm machinery can be dangerous if are not used properly. Each part of the machinery can also be dangerous, if there is improper manipulation or faulty maintenance with the machine. Thus, the operators must ensure they are safety conscious at all times.

In agriculture, a machine operator is responsible for operating and maintaining complicated machinery and making sure it functions properly. For this, a basic knowledge of manuals, regulations, safety instructions, safety signs and signals is essential. In addition to the above, reading the related booklets of machinery is valuable and important.

#### Follow Safety Instructions

- Carefully read all safety messages in the manual and on your machinery safety sings.
- Do not let anyone operate without instruction.
- Learn how to operate the machinery and how to use controls properly.
- Keep your machinery in proper working condition.
- If you do not understand any section of the manual and need assistance, contact your machinery dealer or agency of the company.

## Safety Signs

Agricultural machinery and equipment should be provided with safety signs to alert an operator and others of the risk of personal injury in normal operations and servicing. These safety signs are visible on most agricultural machinery and in operator's manuals. Safety signs are classified according to the relative seriousness of the hazard situation by use signal words. The words CAUTION, WARNING, and DANGER, in that order indicate degrees of hazards. These signal words alert viewers to the existence and relative seriousness of a hazard. There are other words such as, IMPORTANT, ATTENTION, and NOTICE for instructional signs.

### CAUTION

This word indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury.

### WARNING

The word indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.

### DANGER

This word indicates an imminently hazardous situation which, if not avoided, will result in death or serious injury.

Never forget that “prevention is better than cure”.

Remember

Although the number of farm accidents is globally remarkable, there is no clear data available on this topic for Iran.

The manuals provided by manufacturers which cover the operation, servicing, maintenance and repair of their products.

Operator instruction book: This series shows you much more than how to safely operate equipment. These books explain machine capacities and adjustments, how to improve machine performance, how to eliminate unnecessary field operations, and how to service agriculture equipment.

The service includes checking, adjusting and replacing parts in specified time periods. For example, a tractor's services include checking, adjusting and replacing components of fuel system and air cleaner, cooling system, electrical system, transmission and hydraulics, steering, clutch and brakes.

Repair instruction book: These books concentrate on mechanical technology, bringing together technical information and supporting instructional aids that will help you become more proficient in understanding, repairing, and maintaining agricultural equipment and contains information such as technical data and other information needed for repair or replacement of mechanical elements.

Machine element refers to an elementary component of a machine such as frame members, bearings, axles, seals, lubricants, gear trains, belt or chain drives, linkages, cam and follower systems, including brakes and clutches.
